

DON'T TRUST MCP HINT DECLARATIONS. VERIFY THEM.

If your agent platform gates destructive actions on MCP annotations, it is trusting a declaration no one verifies. We scanned 20 public MCP servers and confirmed 23 annotation mismatches — including **20 tools whose code deletes cloud resources while their annotations say nothing at all**, every one of which a policy engine would have waved through without asking a human.

WHAT A SCAN ACTUALLY REACHES

Where the pale bar runs past the solid one, tools exist that a static scanner can see but not follow into a handler body. **Those 139 tools are unchecked, not clean** — a distinction most dashboards erase.

COVERAGE DEPENDS ON THE STACK

KNOWN COVERAGE GAPS — READ THESE AS UNCHECKED

- + Dynamically loaded tools — need runtime tools/List introspection
- + Imported tool arrays — cross-file resolution incomplete
- + Go, Rust, Java, C# — no extractor support yet
